

# Relaunching Perl.com

Past, present and future

# Past

A brief history of [Perl.com](#)

## URGENT SECURITY ANNOUNCEMENT

Anyone running a PC web server will want to read about a glaring security hole big enough to drive the Ben Hur chariot race through. Here's the [latro announcement](#).

---

### Welcome to Mox.Perl.COM!

More than 300 megabytes amongst 14,000 files available!

*Mox nox in rem!*

---

*With a PC, I always felt limited by the software available.  
On Unix, I am limited only by my knowledge.  
--Peter J. Schoenster <[pschon@baste.magibox.net](mailto:pschon@baste.magibox.net)>*

---

#### Perl

Visit the new [Perl Language Home Page](#).

#### Magic: The Gathering

Its biggest WWW site is right here in the [MoxPerl WWW MTG Database](#). Access is now somewhat restricted (e.g. ISPs with broken nameservers are apt to be denied). You are welcome to access the database at the [ITIS mirror site](#), which has more bandwidth.

#### Boulder

## [New Features of Perl 5.14: unicode\\_strings](#)

By [chromatic](#) on June 8, 2011 11:12 AM | [No TrackBacks](#)

Perl 5.14 is now available. While this latest major release of Perl 5 brings with it many bugfixes, updates to the core libraries, and the usual performance improvements, it also includes a few nice new features.

One such feature is the new `unicode_strings` feature, enabled with `use feature 'unicode_strings';` or `use feature ':5.14';`. (Perl 5.12 first introduced this feature, though it remained incomplete until the development of 5.14. Fortunately, you can write `use feature ':5.12';` while running with 5.14 and still get all of the benefits of the improved form in Perl 5.14.)

`unicode_strings` tells the Perl 5 compiler to assume Unicode semantics for all string operations within the enclosing lexical scope. In other words, Perl will treat all strings as if they contain Unicode characters and not merely bytes. This fixes an issue when your code handles text outside of the strict ASCII range.

For example, what should Perl assume if you read a character with a code point between 128 and 255? It's obviously not ASCII text. Is it Latin-1? Is it a raw byte? What should happen?

If you intend it as a Latin-1 character (Ö, for example), then the regular expression metacharacter `\w` should match it, because an O even with a diaeresis is still a letter. The Perl 5 documentation refers to this as "character semantics".

If you intend it as the byte value 214, then `\w` should *not* match it (though why are you using a regular expression against it?). The Perl 5 documentation refers to this as "byte semantics".

Now assume you have several strings from several places and you don't know the exact encodings of all of those sources and you want to concatenate two strings or interpolate them into a third string. What happens?

With `unicode_strings` in effect, Perl 5 prefers to use character semantics for all string operations. You can override this lexically with `no feature 'unicode_strings';` or `use locale;`.

For more information, see [perldoc feature](#) and especially [The Unicode Bug" in perldoc perlunicode](#).

## [New Features of Perl 5.14: IO::File on Demand](#)

By [chromatic](#) on May 24, 2011 1:45 PM | [No TrackBacks](#)

Perl 5.14 is now available. While this latest major release of Perl 5 brings with it many bugfixes, updates to the core libraries, and the usual performance improvements, it also includes a few nice new features.

One such feature is loading [IO::File](#) on demand.

Autovivification of filehandles (colloquially known as "lexical filehandles") has been in Perl 5 since the release of Perl 5.6.0:

```
open my $fh, '>', $filename
or die "Cannot write to '$filename': $!\n";
```

These filehandles behaved something like objects *if* you loaded `IO::File` or [IO::Handle](#), in that you could call methods on them:

```
use IO::File;
```

## Perl Today (February 2014)

By brian d foy on February 10, 2014 6:00 AM

brian d foy is the author of [Mastering Perl](#), now available in its second edition, as well as several other Perl books. As the founder of Perl mongers, he's been active in the Perl community for almost 20 years.

Perl's so big now that it's almost impossible to pay attention to everything going on. Instead of reading the thoughts of me, just one person, on the current state of Perl, why not gather several major players who can cover many areas that you may not have noticed? I've collected some voices from parts of the large and diverse Perl community to highlight a small fraction of everything going on, from community development, hard core coding, the job market, and various problem domains. Although not definitive, their combination makes a good summary.

Randal Schwartz is the original author of *Programming perl* and *Learning Perl*, along with numerous other Perl credits. He's the current host of [FLOSS Weekly](#).

Perl started as a Unix shell replacement to help sysadmins get more productive with less risk and a flatter learning curve (you didn't have to learn the quirks of dozens of small utilities, just the quirks of One [Larry Wall](#)).

But then along came the web, and "scripts" could be used to provide interactive web pages, and Perl became the darling language of the web, first with "cgi-lib.pl", and then with [CGI.pm](#), and later with larger frameworks like [Mason](#) and [Catalyst](#).

Of course, Perl's scripting abilities also matured, and the ability to scale Perl programs with modern testing and OO frameworks (like [Moose](#)) empowered programmers to write 10-line scripts and 100,000-line applications using the same core language features: a distinctive advantage.

Perl 5 development stagnated a bit, triggering the whole "Perl 6" revival, and the relationship between Perl 5 and Perl 6 is still not understood by most people outside the direct Perl community (nor even by some who are \*in\* the community). But with the establishment of the quarterly point release, and the annual major releases, Perl 5 seems to have gotten firmly back in the saddle of modern development again. And while Perl 6 continues to be developed and redesigned, parts of it are already quite useful for early adopters.

Karen Pauley was a founding member of the Belfast Perl Mongers, a volunteer with the YAPC Europe Foundation, and is the President of The Perl Foundation.

For me, Perl is a reason for creating community systems to support Perl itself. [The Perl Foundation](#) doesn't write the Perl language, we don't influence its direction; instead we work with the Perl community to organize funding, volunteers, marketing, and legal counsel.

The [Perl 5 Core Maintenance](#) fund was created in June 2011, in collaboration with some of Perl 5's most generous supporters, such as [Booking.com](#) and [craigslist Charitable Fund](#). Our goal was to pay a few key volunteer developers to spend more of their time working on the maintenance and development of Perl 5. So far we have raised over \$280,000 allowing us to compensate Perl internals experts including Nicholas Clark and Dave Mitchell to do more than they could on an unpaid basis.

[The Perl Foundation](#), with help from our volunteers and donors, will continue to seek ways to strengthen the language, its community, and the F/OSS world in the coming years.

Steffen is a physicist-turned-software developer. A long time contributor to Perl and [author of many Perl modules](#) on the CPAN, he currently works at [Booking.com](#) where he manages software infrastructure development.

**So sad**

**"Present"**

**June 2017 - June 2018**

## **TPC 2017**

"Cheap" solution reading Perly::Bot feed of Perl community articles

- Convert [Perl.com](#) source to markdown-based
- Merge with [PerlTricks.com](#)
- New editor/writer
- Write contributing docs to get new authors
- Contact Perl companies for sponsored posts

## Restoration

- Tarball of [Perl.com](http://perl.com) files
- Incomplete article index
- Embedded data
- No consistent path
- Duplicates

- 712 [Perl.com](#) articles converted to markdown
- 266 [PerlTricks.com](#) articles ported (2013-2017)
- Categories, tags, search
- New design
- Social media integration
- Hosted on GitHub

[\*\*github.com/tpf/perldotcom\*\*](https://github.com/tpf/perldotcom)

## **Since Relaunch (Dec 2017)**

- Sysadmins: Ask Bjoern-Hansen & Robert Spier
- brian d foy co-editor
- 35 new articles

First time authors:

- Andrew Shitov
- Dawn Wallis
- Elizabeth Mattijsen
- Felipe Gasper
- Kivanc Yazan
- Mohammad S Anwar
- Nadim Khemir
- Samuel Andras
- Sawyer X

## Repo contributors:

- Dave Cross
- Dave Rolsky
- Ed J
- JRW
- Jim Keenan
- Jon Frost
- Luca Buchala
- Nour eddin M.
- Skye Shaw
- Tim Heaney

# Last 12 Months Comparison

## **Most popular articles**

1. Perl command line options (2004 - Dave Cross)
2. Beginning Perl (2000 - Doug Sheppard)
3. A short guide to DBI (1999 - MJD)
4. An open letter to the Perl Community (2018 - Liz Mattijsen)
5. Perl and LWP (2002 - Sean M Burke)

# Channels

## Top Channels

# Comparing legacy and modern article pageviews

## Legacy

## Modern

**Future**

**Objective: more pageviews**

To get more pageviews we need to:

1. Publish more popular articles
2. Publish more frequently
3. Keep visitors for longer

## **More popular articles**

- More beginner topics
- Mine adwords for popular search topics (for "bounties")

## **Publish more frequently**

- Ask for help more
- Better contributing docs
- Recognition & rewards
- Corporate sponsorship for article "bounties"

## **Keep visitors for longer**

- "You may also like ..."
- Archive page

**THANK YOU**
